ABSTRACT OF THE DISCLOSURE

The present invention relates to an amide compound of the formula

5 wherein R^1 is a hydrogen and the like, R^2 is a hydrogen and the like, X is SO_2 and the like, Y is the formula (III) and the like and a is 2, an isomer thereof or pharmaceutically acceptable salts thereof. The compound of the present invention shows a remarkable and selective Rho kinase
 10 inhibitory action, is free of problematic toxicity, shows fine oral absorption and drug kinetics (absorption, distribution, metabolism, excretion and the like of the drug), and shows superior properties (e.g., stability etc.) as a compound. Accordingly, it can be used as a therapeutic drug for various
 15 diseases in which Rho kinase is involved.

DESCRIPTION

AMIDE COMPOUNDS AND USE THEREOF

TECHNICAL FIELD

The present invention relates to a novel amide compound
5 having a Rho kinase inhibitory action. Moreover, the present
invention relates to use of the compound as a pharmaceutical
agent, a reagent or a diagnostic agent.

BACKGROUND ART

Ever since the discovery of Ras in 1981, a number of
10 small GTP binding proteins (small G proteins) similar to Ras
have been found, and many physiological functions they possess
have been studied. These small G proteins have a molecular
weight of 20,000-30,000 and do not have a subunit structure.
They all specifically bind GDP and GTP, and hydrolyze the thus-
15 bound GTP (GTPase activity) (Hall, A., Science, 249, 635-640,
1990; Bourne, H. R. et al., Nature, 349, 117-127, 1991).

To date, more than 50 kinds of genes encoding these
small G proteins have been found from yeast to mammals, forming
a superfamily. These small G proteins are largely divided into
20 5 groups of Ras, Rho, Rab, Arf and others, according to the
similarity of their amino acid sequences.

Of these, Rho was named so because its gene isolated in
the form of cDNA from sea hare neuromuscle encodes a
polypeptide having about 35% homology with Ras (Ras homologue)
25 (Madaule, P., Cell, 41, 31-40, 1985).

Rho is specifically ADP ribosylated by C3 enzyme, which
is one of the botulinum toxins, and Staphylococcal toxin EDIN,
and inactivated (Narumiya, S. and Morii, S., Cell Signal, 5, 9-
19, 1993; Sekine, A. et al., J. Biol. Chem., 264, 8602-8605,
30 1989). Hence, the C3 enzyme and EDIN were used to study the
involvement of Rho in cell functions from various aspects.

For example, phosphorylation by myosin light chain (MLC)
kinase is considered to enable actin-myosin interaction and
initiate contraction of smooth muscle, and the structure of

smooth muscle myosin phosphatase, which dephosphorylates MLC, has been clarified (Shimizu, H. et al., J. Biol. Chem., 269, 30407-30411). It has been clarified that the activity of myosin phosphatase is, like MLC kinase, under the control of the intracellular signal transduction system and Rho is involved in this mechanism. Moreover, an active Rho bound with GTP has been found to enhance Ca-dependent contraction in a smooth muscle skinned fiber specimen (Hirata, K., J. Biol. Chem., 267, 8719-8722, 1992), thereby suggesting that the increase in Ca sensitivity in smooth muscle contraction is caused by the inhibition of myosin phosphatase activity via Rho.

In Swiss 3T3 cell and 3Y1 cell, moreover, Rho-dependent promotion of tyrosine phosphorylation (Kumagai, N. et al., J. Biol. Chem., 270, 8466-8473, 1993) and activation of many kinds of serine/threonine kinases (Kumagai, N. et al., FEBS Lett., 366, 11-16, 1995) have been acknowledged. From this, the presence of plural protein kinases in the downstream of Rho in the signal transduction pathway via Rho has been suggested and, serine/threonine kinase (Rho kinase) activated along with the activation of Rho, such as ROC α (Leung, T. et al., J. Biol. Chem., 270, 29051-29054, 1995) [another name Rho-kinase, ROCK-II] and p160ROCK (Ishizaki, T. et al., EMBO J., 15, 1885-1893, 1996) [another name ROC β , ROCK-I], have been reported as one of the proteins that transduct signals from Rho.

In addition, it has been reported that this Rho kinase directly phosphorylates myosin phosphatase and inhibits its activity (Kimura, K. et al., Science, 273, 245-248, 1996).

In recent years, a certain kind of amide compound has been found to be a selective Rho kinase inhibitor (Uehata, M. et al., Nature, 389, 990-994, 1996, WO 98/06433), and further, certain kinds of isoquinoline sulfonamide derivatives (WO 98/06433) and isoquinoline derivatives (Naunyn-Schmiedeberg's Archives of Pharmacology 385(1) Suppl. R219 1998, 11) have been

found to be Rho kinase inhibitors.

In addition, certain kinds of vinylbenzene derivatives such as ethacrynic acid, 4-[2-(2,3,4,5,6-pentafluorophenyl)-acryloyl]cinnamic acid and the like, and cinnamic acid derivatives have been recently reported as Rho kinase inhibitors (WO 00/57914, JP-A-2000-44513).

Particularly, various physiological functions of signal transduction via Rho-Rho kinase have been elucidated using (+)-trans-4-(1-aminoethyl)-1-(4-pyridylcarbonyl)cyclohexane, which is one of the above-mentioned selective Rho kinase inhibitors.

For example, it has been clarified that a selective Rho kinase inhibitor suppresses formation of desmosome and a stress fiber, which is due to the stimulation of Rho or LPA (lysophosphatidic acid), and shows an inhibitory activity on the contraction caused by calcium sensitivity accentuation in smooth muscle (Uehata, M. et al., Nature, 389, 990-994, 1996).

In addition, this inhibitor has been reported to be involved in various cell functions such as an inhibitory action on neurite degeneracy by LPA in nerve cell-derived cultured cell, NIE-115 cell (Hirose, M. et al., J. Cell Biol. 141, 1625-1636, 1998), an inhibitory action on the activation of 1 type $\text{Na}^+\text{-H}^+$ exchanger (Tominaga, T. et al., EMBO J. 17, 4712-4722, 1998).

Furthermore, a concentration-dependent inhibition of AH cell invasion by a specific ROCK/Rho kinase inhibitor in an invasion model of rat ascites hepatoma (AH cell) into homogeneous rat single layer mesothelial cell layer has been reported (Itoh, K. et al., Nature Med. 5, 221-225, 1999), that kinematic accentuation of cells via Rho-Rho kinase has been found to be critical to cancer cell invasion and metastasis, and further that transformation via Rho-Rho kinase is critical in the malignant alteration of cancer cells (Sahai, E. et al., Curr. Biol. 9, 136-145, 1999).

A signal transduction via Rho-Rho kinase is considered

to be involved in a great diversity of cell phenomena, such as smooth muscle contraction, cell movement, cell adhesion, morphological change of cells, cell growth and the like, and therefore, a drug that blocks the function of Rho-Rho kinase
5 has a potential of becoming a therapeutic agent of diseases such as hypertension, pulmonary hypertension, angina pectoris, cerebrovascular contraction, asthma, peripheral circulation disorder, glaucoma, erectile dysfunction and the like, in which smooth muscle contraction is involved, invasion and metastasis
10 of cancer, angiostenosis, arteriosclerosis, retinopathy, immune response, fibrosing disease, ischemia-reperfusion injury and the like, in which cell movement is involved, metastasis of cancer, inflammation, autoimmune disease, AIDS, ischemia-reperfusion injury and the like, in which cell adhesion is
15 involved, brain function disorder, osteoporosis (bone formation and resorption) and the like, in which morphological change of cell is involved, and cancer, arteriosclerosis, ischemia-reperfusion injury and the like, in which cell growth is involved.

20 Accordingly, a specific Rho kinase inhibitor can be a therapeutic drug of various diseases, and creation of a superior new compound is desired.

It is an object of the present invention to provide a novel compound having a Rho kinase inhibitory activity, which
25 has a potential of becoming a therapeutic drug of the diseases in which Rho-Rho kinase is involved.

The present inventors have conducted intensive studies in view of the above-mentioned situation, and found that a novel amide compound represented by the following formula (I),
30 an isomer thereof and a pharmaceutically acceptable salt thereof have a potent Rho kinase inhibitory activity and completed the present invention. They have also found that the compound of the present invention can be useful as a therapeutic agent for various diseases where Rho-Rho kinase is

involved, a reagent having a Rho kinase inhibitory activity and a diagnostic agent of diseases caused by Rho kinase, which resulted in the completion of the present invention.

DISCLOSURE OF INVENTION

Accordingly, the present invention provides the following.

(1) An amide compound of the formula

wherein

- 10 R^1 is hydrogen, alkyl, cycloalkyl, halogen, hydroxyl, alkoxy, haloalkyl, hydroxyalkyl, aralkyl, acyl, alkoxy carbonyl, alkyl carbamoyl, alkyl sulfone, nitro, amino optionally having substituents, cyano or phenyl;
- 15 R^2 is hydrogen, alkyl, cycloalkyl, phenyl or aralkyl, or a group represented by the formula (II)

in the formula (II), R^3 is hydrogen, alkyl or amino optionally having substituents, and R^4 is hydrogen, alkyl, aralkyl, phenyl, nitro or cyano, or R^3 and R^4 may be bonded to form a heterocyclic ring containing, in the ring, oxygen atom, sulfur atom or nitrogen atom optionally having a substituent;

- 20 a is an integer of 1 to 4;
- X is CH_2 , O, S, SO_2 or NR^7 wherein R^7 is hydrogen, alkyl, aralkyl, haloalkyl or acyl; and
- 25 Y is a group of the formula (III), (IV), (V) or (VI):

(III)

(IV)

(V)

(VI)

in the formulas (III), (IV), (V) and (VI), R^5 and R^6 are the same or different and each is hydrogen, alkyl, cycloalkyl, phenyl, halogen, hydroxyl, alkoxy, alkoxyalkyl, nitro, amino optionally having substituents or cyano,

an isomer thereof or a pharmaceutically acceptable salt thereof.

(2) The amide compound of the above-mentioned (1), wherein, in the formula (I), R^1 is hydrogen, alkyl, halogen, hydroxyl, alkoxy, nitro, amino optionally having substituents or cyano; R^2 is hydrogen; a is an integer of 1 to 3; X is CH_2 , S, O or SO_2 ; and Y is a group of the formula (III), (IV) or (V), wherein R^5 and R^6 in the formulas (III), (IV) and (V) are the same or different and each is hydrogen, alkyl, halogen, hydroxyl, alkoxy, nitro, amino optionally having substituents or cyano, an isomer thereof or a pharmaceutically acceptable salt thereof.

(3) The amide compound of the above-mentioned (2), which is selected from the group consisting of

- (S)-4-amino-N-(4-pyridyl)thiochromane-7-carboxamide,
- (S)-4-amino-N-(4-pyridyl)thiochromane-7-carboxamide 1,1-dioxide,
- (S)-4-amino-N-(1H-pyrazolo[3,4-b]pyridin-4-yl)thiochromane-7-carboxamide,
- (S)-4-amino-N-(1H-pyrazolo[3,4-b]pyridin-4-yl)thiochromane-7-carboxamide 1,1-dioxide,
- (S)-4-amino-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)thiochromane-7-carboxamide and

(S)-4-amino-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)thiochromane-7-carboxamide 1,1-dioxide,

an isomer thereof or a pharmaceutically acceptable salt thereof.

- 5 (4) The amide compound of the above-mentioned (2), which is selected from the group consisting of

(S)-4-amino-6-methyl-N-(4-pyridyl)thiochromane-7-carboxamide,

(S)-4-amino-6-methyl-N-(4-pyridyl)thiochromane-7-carboxamide 1,1-dioxide,

- 10 (S)-4-amino-6-chloro-N-(4-pyridyl)thiochromane-7-carboxamide, (S)-4-amino-6-chloro-N-(4-pyridyl)thiochromane-7-carboxamide 1,1-dioxide,

(S)-4-amino-8-methyl-N-(4-pyridyl)thiochromane-7-carboxamide,

(S)-4-amino-8-methyl-N-(4-pyridyl)thiochromane-7-carboxamide

- 15 1,1-dioxide,

(S)-4-amino-6-methyl-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)thiochromane-7-carboxamide 1,1-dioxide and

(S)-4-amino-6-chloro-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)thiochromane-7-carboxamide 1,1-dioxide,

- 20 an isomer thereof or a pharmaceutically acceptable salt thereof.

(5) A pharmaceutical agent comprising the amide compound of any of the above-mentioned (1) to (4), an isomer thereof or a pharmaceutically acceptable salt thereof.

- 25 (6) A pharmaceutical composition comprising the amide compound of any of the above-mentioned (1) to (4), an isomer thereof or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

- (7) The pharmaceutical agent of the above-mentioned (5),
30 wherein the pharmaceutical agent is at least one member selected from the group consisting of an anticancer drug, a suppressive agent of metastasis of cancer, a suppressive agent of angiogenesis, an antihypertensive, an anti-pulmonary hypertension drug, an anti-angina pectoris drug, a

- cerebrovascular contraction suppressive agent, an anti-asthma drug, a peripheral circulation-improving drug, an early delivery-preventive drug, an anti-arteriosclerosis drug, a suppressive agent of angiostenosis, an anti-inflammatory agent,
- 5 an analgesic, an immunosuppressant, a suppressive agent of autoimmune disorder, an anti-AIDS drug, an inhibitor of fertilization and implantation of fertilized egg, a bone formation-promoting drug, a bone resorption inhibitor, a therapeutic agent of retinopathy, a therapeutic agent of
- 10 glaucoma, a nerve axon-regenerating drug, a brain function-improving drug, a preventive of cell infection of digestive tract, a suppressive agent of fibrosis of various organs, a therapeutic agent of erectile dysfunction and an agent for the prophylaxis or therapy of ischemia-reperfusion injury.
- 15 (8) A Rho kinase inhibitor comprising the amide compound of any of the above-mentioned (1) to (4), an isomer thereof or a pharmaceutically acceptable salt thereof.
- (9) A therapeutic drug for a disease, in which Rho kinase is involved, which comprises the amide compound of any of the
- 20 above-mentioned (1) to (4), an isomer thereof or a pharmaceutically acceptable salt thereof.
- (10) A reagent comprising the amide compound of any of the above-mentioned (1) to (4), an isomer thereof or a pharmaceutically acceptable salt thereof.
- 25 (11) A diagnostic agent comprising the amide compound of any of the above-mentioned (1) to (4), an isomer thereof or a pharmaceutically acceptable salt thereof.

BRIEF DESCRIPTION OF THE DRAWING

Fig. 1 shows a DNA sequence of a part of an expression

30 vector for human ROCK-1 kinase domain part (1 to 477 amino acids) wherein a His-Tag sequence has been added to the C-terminal and the amino acid sequence of the C-terminal of said human ROCK-1 kinase domain part.

DETAILED DESCRIPTION OF THE INVENTION

In the present specification, each substituent of the above-mentioned formula (I) is defined as follows.

Alkyl for R^1 , R^2 , R^3 , R^4 , R^5 and R^6 is linear or branched alkyl having 1 to 10 carbon atoms, which is exemplified by methyl, ethyl, propyl, isopropyl, butyl, isobutyl, secondary butyl, tertiary butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl and the like, with preference given to alkyl having 1 to 4 carbon atoms.

Cycloalkyl for R^1 , R^2 , R^5 and R^6 is that having 3 to 6 carbon atoms and is exemplified by cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and the like.

Halogen for R^1 , R^5 and R^6 is fluorine, chlorine, bromine or iodine.

Alkoxy for R^1 , R^5 , and R^6 is linear or branched alkoxy having 1 to 4 carbon atoms, which is exemplified by methoxy, ethoxy, propoxy, isopropoxy, butoxy, tertiary butoxy and the like.

Amino optionally having substituents for R^1 , R^3 , R^5 and R^6 is optionally substituted by substituent(s) selected from the group consisting of alkyl having 1 to 4 carbon atoms, acyl having 1 to 4 carbon atoms and benzoyl. Examples thereof include amino, methylamino, dimethylamino, ethylamino, diethylamino, formylamino, acetylamino, propionylamino, benzoylamino and the like.

Aralkyl for R^1 , R^2 and R^4 is that wherein alkyl moiety is alkyl having 1 to 4 carbon atoms and is exemplified by benzyl, 1-phenylethyl, 2-phenylethyl and the like.

Hydroxyalkyl for R^1 is linear or branched alkyl having 1 to 6 carbon atoms which is substituted by 1 to 3 hydroxy, which is exemplified by hydroxymethyl, 2-hydroxyethyl, 1-hydroxyethyl, 3-hydroxypropyl, 4-hydroxybutyl and the like.

Haloalkyl for R^1 is alkyl for R^1 , which is substituted by 1 to 5 halogen and exemplified by fluoromethyl, difluoromethyl,

trifluoromethyl, 2,2,2-trifluoroethyl, 2,2,3,3,3-pentafluoropropyl and the like.

Acyl for R^1 is alkanoyl having 2 to 6 carbon atoms (acetyl, propionyl, butyryl, valeryl, pivaloyl etc.), benzoyl, or phenylalkanoyl wherein the alkanoyl moiety has 2 to 4 carbon atoms (phenylacetyl, phenylpropionyl, phenylbutyryl etc.).

Alkoxycarbonyl for R^1 is that wherein the alkoxy moiety is linear or branched alkoxy having 1 to 6 carbon atoms, which is exemplified by methoxycarbonyl, ethoxycarbonyl, propoxycarbonyl, isopropoxycarbonyl, butoxycarbonyl, isobutoxycarbonyl, secondary butoxycarbonyl, tertiary butoxycarbonyl, pentyloxycarbonyl, hexyloxycarbonyl and the like.

Alkylcarbamoyl for R^1 is carbamoyl mono- or di-substituted by alkyl having 1 to 4 carbon atoms, which is exemplified by methylcarbamoyl, dimethylcarbamoyl, ethylcarbamoyl, diethylcarbamoyl, propylcarbamoyl, dipropylcarbamoyl, butylcarbamoyl, dibutylcarbamoyl and the like.

Alkylsulfone for R^1 is that wherein the alkyl moiety is linear or branched alkyl having 1 to 6 carbon atoms, which is exemplified by methylsulfone, ethylsulfone, propylsulfone, isopropylsulfone, butylsulfone, isobutylsulfone, secondary butylsulfone, tertiary butylsulfone, pentylsulfone, hexylsulfone and the like.

Alkoxyalkyl for R^5 and R^6 is that wherein the alkoxy moiety is linear or branched alkoxy having 1 to 4 carbon atoms as exemplified for R^1 , and the alkyl moiety is alkyl having 1 to 4 carbon atoms. Examples thereof include methoxymethyl, 2-methoxyethyl, 1-methoxyethyl, 3-methoxypropyl, 4-methoxybutyl, ethoxymethyl, propoxymethyl, butoxymethyl and the like.

The group formed by R^3 and R^4 in combination, which forms a heterocyclic ring optionally having, in the ring, oxygen atom, sulfur atom or nitrogen atom optionally having a

substituent, is, for example, imidazol-2-yl, thiazol-2-yl, oxazol-2-yl, imidazolin-2-yl, 3,4,5,6-tetrahydropyridin-2-yl, 3,4,5,6-tetrahydropyrimidin-2-yl, 1,3-oxazolin-2-yl, 1,3-thiazolin-2-yl, or benzoimidazol-2-yl, benzothiazol-2-yl or
 5 benzooxazol-2-yl, which optionally has substituents such as halogen, alkyl, alkoxy, haloalkyl, nitro, amino, phenyl, aralkyl and the like. As used herein, halogen, alkyl, alkoxy, haloalkyl and aralkyl are as defined for R¹. The substituent of the above-mentioned nitrogen atom optionally having a
 10 substituent is exemplified by alkyl, aralkyl, haloalkyl and the like. As used herein, alkyl, aralkyl and haloalkyl are those defined for R¹.

Alkyl, aralkyl, haloalkyl and acyl for R⁷ when X is NR⁷ are those defined for R¹.

A pharmaceutically acceptable salt of the compound of the present invention is exemplified by a salt with an inorganic acid such as hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, nitric acid and the like, and a salt with an organic acid such as acetic acid, propionic acid, succinic acid, maleic acid, fumaric acid, benzoic acid, citric acid, malic acid, methanesulfonic acid, benzenesulfonic acid and the like. Their hydrates (1 hydrate, 2 hydrate, 3 hydrate, 1/2 hydrate, 3/2 hydrate, 1/4 hydrate, 4/5 hydrate, 1/5 hydrate, 3/4 hydrate, 1/3 hydrate, 5/3 hydrate, 5/4 hydrate etc.), solvates and the like are also encompassed in the compound of the present invention. In addition, N-oxide

compounds are also encompassed in the compound of the present invention.

When the compound of the present invention contains a geometrical isomer, the present invention encompasses an isomer, a trans isomer and a mixture thereof. When the compound of the present invention has one or more asymmetric centers in one molecule, various optical isomers are present. The present invention encompasses an optical isomer, a racemate and a diastereomer, and a mixture thereof.

The compound of the formula (I) of the present invention can be synthesized according to the following Methods 1 to 4.

Method 1:

wherein Z is an amine-protecting group generally used in the organic synthesis chemistry, such as benzyloxycarbonyl, tertiary butoxycarbonyl, benzyl and the like, and other symbols are as defined above.

The condensation reaction of the compound of the formula (VII) and the compound of the formula (VIII) can be carried out according to the following three methods.

(1) The compound (VII) is converted to an acid halide by a conventional method using a halogenating agent such as thionyl chloride etc., and condensed with compound (VIII) in a suitable

solvent (acetonitrile, dichloromethane, dichloroethane, chloroform etc.) in the presence of a base (triethylamine, diisopropylethylamine, pyridine, sodium methoxide, sodium ethoxide, sodium hydroxide, potassium hydroxide, sodium acetate etc.) at -20°C to the refluxing temperature of the solvent for 30 min to 12 hr to give compound of the formula (IX). In this reaction, the base to be used may be used as a solvent. The amino group of compound (IX) is deprotected under the conditions generally used in the organic synthesis chemistry (hydrogen-palladium catalyst, 4 mol/L hydrochloric acid-dioxane, trifluoroacetic acid, hydrobromic acid-acetic acid etc.) to synthesize the compound of the formula (I). These reactions generally complete within 24 hours.

(2) The compound (IX) can be produced by condensing compound (VII) with compound (VIII) in, where necessary, a suitable solvent (N,N-dimethylformamide, dimethyl sulfoxide, methanol, ethanol, isopropyl alcohol, butanol etc.) in the presence of a condensing agent (1,3-dicyclohexylcarbodiimide, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide, carbonyldiimidazole, diethyl cyanophosphate, 2-chloro-1-methylpyridinium iodide etc.), or by condensing compound (VII) with compound (VIII) in a suitable solvent (N,N-dimethylformamide, dimethyl sulfoxide etc.) in the presence of a phosphoric ester such as diethyl cyanophosphate etc. and a base (triethylamine, pyridine etc.). The reaction temperature is generally 0°C to 100°C, and the reaction time is generally 30 minutes to 24 hours. The reaction using a condensing agent may be carried out in the presence of 1-hydroxybenztriazole and the like as necessary. Then, the amino group of compound (IX) is deprotected under the conditions generally used in the organic synthesis chemistry (hydrogen-palladium catalyst, 4 mol/L hydrochloric acid-dioxane, trifluoroacetic acid, hydrobromic acid-acetic acid etc.) to synthesize the compound of the formula (I). These reactions generally complete within 24 hours.

(3) The compound (VII) is converted to a mixed acid anhydride with carbonate (methyl chlorocarbonate, ethyl chlorocarbonate etc.) and the like, and condensed with compound (VIII) in a suitable solvent (methanol, ethanol, isopropyl alcohol, butanol, ethylene glycol, tetrahydrofuran, toluene, nitrobenzene or a mixed solvent of these etc.) or without solvent in the presence of a base (triethylamine, pyridine, sodium methoxide, sodium ethoxide, sodium hydroxide, potassium hydroxide etc.) at -50°C to the refluxing temperature of the solvent for 1-24 hr to synthesize compound (IX). Then, the amino group of compound (IX) is deprotected under the conditions generally used in the organic synthesis chemistry (hydrogen-palladium catalyst, 4 mol/L hydrochloric acid-dioxane, trifluoroacetic acid, hydrobromic acid-acetic acid etc.) to synthesize the compound of the formula (I). These reactions generally complete within 24 hours.

When Y of the formula (VIII) is represented by the formula (IV), (V) or (VI)

(IV)

(V)

(VI)

the objective compound of the formula (I) can be synthesized by protecting the secondary amine in the pyrrolopyridine (IV), pyrazolopyridine (V) or dihydropyrrolopyridine (VI) ring with an amine-protecting group (acetyl, trimethylsilylethoxymethyl, tertiary butoxycarbonyl, benzyloxycarbonyl, trityl etc.) generally used for organic synthesis, and carrying out the above-mentioned reaction, and after the reaction, eliminating the protecting group by the above-mentioned conventional method.

The compound of the formula (VII) can be synthesized by the method described in the following Methods 6 to 8, the

compound of the formula (IX) wherein Y is represented by the formula (IV) or (V) can be synthesized by the method described in the following Method 5, and the amine compound of the formula (VIII) can be synthesized by the method described in WO 93/0521.

Method 2:

wherein each symbol is as defined above.

The compound of the formula (XI) can be synthesized by reacting the compound of the formula (X) and compound (VIII) by the amide synthetic method described in Method 1. The compound (XI) and compound of the formula (XII) can be led to the compound of the formula (I) by reductive amination. For example, compound (XI) and compound (XII) are reacted in a solvent that does not inhibit the progress of the reaction (methanol, ethanol, methylene chloride, chloroform, acetonitrile, tetrahydrofuran, N,N-dimethylformamide or an optionally mixed solvent thereof etc.) at a temperature of from cooling to the refluxing temperature of the solvent (preferably 0°C to room temperature) for 10 minutes to 24 hours. The compound of the formula (I) can be obtained by adding a reducing agent generally used for organic synthesis (sodium borohydride, sodium cyanoborohydride etc.) to the reaction mixture under cooling to the refluxing temperature of

the solvent (preferably 0°C to room temperature) and allowing reaction at the same temperature for 10 minutes to 3 days. The compound of the formula (I) can be also synthesized by using, instead of adding a reducing agent, a catalytic hydrogenation reaction (hydrogen-palladium catalyst, hydrogen-Raney-nickel etc.).

Method 3: A compound of the formula (I) wherein R² is represented by the formula (II)

can be synthesized by the following method.

wherein R² is represented by the formula (II), when R³ is an amino group, it may be protected by tertiary butoxycarbonyl, benzyloxycarbonyl, acetyl, benzoyl and the like, W is O, S or a heterocyclic ring such as pyrazole and the like, V is hydrogen; lower alkyl (methyl, propyl etc.), benzyl, p-nitrobenzyl and the like, and other symbols are as defined above.

The objective compound of the formula (I) can be synthesized by condensing compound of the formula (XIII) [compound of the formula (I) wherein R² is hydrogen] with compound of the formula (XIV) or an acid addition salt thereof. For example, the reaction can be carried out in a suitable solvent (water, methanol, ethanol, N,N-dimethylformamide, dioxane, tetrahydrofuran or an optionally mixed solvent thereof etc.) at an optional temperature (preferably 0-100°C) for 30 minutes to 48 hours. Where necessary, a base (potassium

hydroxide, sodium hydroxide, potassium carbonate, sodium carbonate, triethylamine, diisopropylethylamine, 4-dimethylaminopyridine etc.) is preferably used as a deoxidizing agent.

- 5 **Method 4:** A compound of the formula (I) wherein Y is represented by the formula (VI)

can be synthesized by the following method.

- 10 wherein Y represents the formula (VI) and other symbols are as defined above.

The compound of the formula (XV) [compound of the formula (I) wherein Y has the formula (V)] is subjected to hydrogenation (1-50 pressure) in a suitable solvent (trifluoroacetic acid, methanol, ethanol, isopropyl alcohol etc.) in the presence of a catalyst (palladium-carbon, platinum oxide, Raney-nickel etc.) at a temperature of from room temperature to 100°C to synthesize the objective compound of the formula (I). The reaction generally ends in 24 hours. In this reaction, an acid (hydrochloric acid, acetic acid etc.) may be added as necessary.

Method 5: The compound of the formula (IX) wherein Y is the formula (IV) or (V)

(IV)

(V)

can be synthesized by the following method.

wherein Y represents the formula (IV) or (V), U represents $-\text{CH}=\text{}$ or $-\text{N}=\text{}$, and other symbols are as defined above.

The compound of the formula (XVI) can be synthesized by reacting compound (VII) and two equivalents of compound (VIII) by the amide synthetic method mentioned under Method 1. The objective compound of the formula (IX) can be synthesized by hydrolysis or alcoholysis of compound (XVI) in a solvent (methanol, ethanol, isopropyl alcohol, water or an optionally mixed solvent thereof etc.) from 0°C to the boiling point of the solvent for 30 min to 24 hr. In this reaction, a base (sodium hydroxide, potassium hydroxide, sodium methoxide, potassium carbonate, sodium carbonate, sodium hydrogencarbonate

etc.) may be added as necessary.

Method 6: The compound of the formula (VII) can be synthesized by the following method.

5 wherein B is a carboxylic acid-protecting group generally used in the organic chemistry [e.g., methyl, ethyl, tertiarybutyl etc.], and other symbols are as defined above.

The compound of the formula (XVIII) can be synthesized by adding a reagent generally used for protecting the amino
 10 group thereof (benzyloxycarbonyl chloride, anhydrous tertiary butoxycarboxylic acid etc.) to the compound of the formula (XVII) in a suitable solvent (ethyl acetate, tetrahydrofuran, N,N-dimethylformamide, dichloromethane, chloroform, diethyl
 ether, water or an optionally mixed solvent thereof etc.) in
 15 the presence of a base (sodium hydride, sodium hydroxide, potassium hydroxide, potassium carbonate, sodium carbonate, sodium methoxide, sodium ethoxide, triethylamine, diisopropylethylamine etc.) and reacting the mixture at a
 temperature of from -20°C to the boiling point of the solvent
 20 (preferably 0°C to room temperature) for 1 min to 24 hr. Then compound (XVIII) is reacted in a suitable solvent (tetrahydrofuran, diethyl ether, ethyl acetate, methanol, ethanol, isopropyl alcohol, tertiary butyl alcohol, water or an

optionally mixed solvent thereof etc.) under the conditions generally used for removing the carboxylic acid-protecting group (sodium hydride-water, potassium carbonate-water, trifluoroacetic acid etc.) at a temperature of from 0°C to the boiling point of the solvent for 1 min to 24 hr to give compound (VII).

The compound of the formula (XVII) can be synthesized by the methods described in Methods 9-11.

Method 7: The compound of the formula (VII) wherein X is SO₂ can be synthesized by the following method.

wherein X represents SO₂ and other symbols are as defined above.

The compound of the formula (XIX) [compound of the formula (XVIII) wherein X is S] is reacted in a suitable solvent (ethyl acetate, tetrahydrofuran, N,N-dimethylformamide, dichloromethane, chloroform, diethylether, acetone, water or an optionally mixed solvent thereof etc.) using an oxidizing agent (meta-chloroperoxybenzoic acid, chromium oxide, pyridinium chlorochromate [PCC], 2KHSO₅·KHSO₄·K₂SO₄ etc.) generally used at a temperature of from 0°C to the boiling point of the solvent for 1 min to 24 hr to synthesize the compound of the

formula (XX).

Furthermore, compound (XX) is subjected to deprotection of the carboxyl group according to the method described in Method 6 to give the objective compound (VII).

5 In addition, a compound of the formula (VII) wherein X is S can be directly reacted under the reaction conditions of the oxidization method of sulfur atom mentioned above, which have been appropriately determined, to lead to the objective compound (VII) (compound wherein X is SO₂).

10 **Method 8:** The compound of the formula (VII) can be synthesized by the following method.

wherein each symbol is as defined above.

The compound of the formula (XXI) can be led to a
 15 compound of the formula (XXII) by the Friedel-Crafts reaction. For example, compound (XXII) can be synthesized by reacting compound (XXI) in a suitable solvent (methylene chloride, chloroform, nitrobenzene etc.) using acetic anhydride or acetyl chloride and a Lewis acid (aluminum chloride, tin
 20 tetrachloride, titanium tetrachloride etc.) at a temperature of from -20°C to the boiling point of the solvent for 1 min to 24 hr.

Then, compound (XXII) can be converted to compound (VII)

by haloform reaction. For example, compound (XXII) is dissolved in a suitable solvent (methanol, ethanol, isopropyl alcohol, water or an optionally mixed solvent thereof etc.), treated with halogen or an equivalent thereof (chlorine, bromine, iodine, sodium hypochlorite etc.) in the presence of a base (sodium hydroxide, potassium hydroxide etc.) at 0 to 150°C for 30 min to 24 hr, and neutralized with an acid (hydrochloric acid, sulfuric acid, acetic acid etc.) to synthesize compound (VII).

10 **Method 9:** The compound of the formula (XVII) wherein R² is hydrogen can be synthesized by the following method.

wherein R² is hydrogen and other symbols are as defined above.

The compound of the formula (XXIII) is dissolved in a suitable solvent (tetrahydrofuran, diethylether, enol, methanol or an optionally mixed solvent thereof etc.), a reducing agent (sodium borohydride, lithium aluminum hydride etc.) generally used is added, and the mixture is reacted under cooling to the refluxing temperature of the solvent for 1 min to 24 hr to give a compound of the formula (XXIV). In this case, an optically activated compound (XXIV) can be obtained by applying the generally employed asymmetric reduction of carbonyl [method using borane-(R) or (S)-5,5-diphenyl-2-methyl-3,4-propano-1,3,2-oxazaborolidine, hydrogen-(R) or (S)-

bis(diphenylphosphino)-1,1'-binaphthyl etc.].

Then, compound (XXIV) is dissolved in a suitable solvent (tetrahydrofuran, diethylether, toluene, benzene, dichloromethane, chloroform etc.) and reacted using generally
 5 used azidation (diphenylphosphorylazide-1,8-diazabicyclo-[5,4,0]-7-undecene, diphenylphosphorylazide-triphenylphosphine-diethylazadicarboxylate, methanesulfonic anhydride-sodium azide etc.) at a temperature of from -78°C to the refluxing
 10 temperature of the solvent for 1 min to 72 hr to give the compound of the formula (XXV).

The obtained compound (XXV) is dissolved in a suitable solvent (tetrahydrofuran, diethylether, toluene, benzene, ethanol, methanol, water or an optionally mixed solvent thereof etc.), and reacted using a reducing agent (triphenylphosphine,
 15 tin tetrachloride, hydrogen-palladium catalyst etc.) at a temperature of from under ice-cooling to the refluxing temperature of the solvent for 1 min to 24 hr to give the objective compound (XVII) (compound wherein R² is hydrogen).

The compound (XXIII) can be obtained according to the
 20 methods described in Tetrahedron Lett. pp. 5499-5502 (1992), Ger. Offen. DE 19532312 A16 WO 9709327 A1 and J. Org. Chem. pp. 1216-1218 (1994).

Method 10: The compound of the formula (XVII) wherein R² is alkyl or aralkyl can be synthesized by the following method.

wherein R^{2a} is hydrogen, alkyl, phenyl or aralkyl, R² is alkyl or aralkyl, and other symbols are as defined above.

The objective compound (XVII) can be synthesized by reductive amination described for Method 2 of the compound of

the formula (XXVI) [compound of the formula (XVII) wherein R^2 is hydrogen] and the compound of the formula (XXVII).

Method 11: The compound of the formula (XVII) can be synthesized by the following method.

wherein each symbol is as defined above.

The compound (XVII) can be synthesized by subjecting the compound of the formula (XXIII) and compound (XII) to the reductive amination described in Method 2. The compound of the formula (XVII) wherein R^2 is hydrogen can be synthesized by using hydroxyamine instead of compound (XII).

The compound of the present invention can be isolated and purified by a method known in the field of the organic synthesis chemistry such as recrystallization, column chromatography and the like. When the obtained product is a racemate, it can be resolved into a desired optically active form by, for example, fractionation crystallization with a salt of an optically active acid or base, or by passing through a column packed with an optically active carrier. These optically active forms can be also produced by using an optically active starting material compound.

A pharmaceutically acceptable salt of the compound of the formula (I) can be formed by a conventional method. The acid to be used for forming an acid is appropriately selected from inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid and the like, organic acids such as methanesulfonic acid, fumaric acid, maleic acid, mandelic acid, citric acid, tartaric acid, salicylic acid and the like, amino acids such as lysin and the like, and metal such as sodium,

potassium, calcium, magnesium, aluminum and the like. These acid addition salts can be converted to the corresponding free base according to a conventional method by, for example, reaction with alkali such as sodium hydroxide, potassium
5 hydroxide and the like. It is possible to form a quaternary ammonium salt.

The compound of the formula (I) of the present invention thus formed shows a remarkable and selective Rho kinase inhibitory action, is free of problematic toxicity, shows fine
10 oral absorption and drug kinetics (absorption, distribution, metabolism, excretion and the like of the drug), and shows superior properties (e.g., stability etc.) as a compound. Accordingly, it can be used as a therapeutic drug for various diseases in which Rho kinase is involved.

15 The compound of the present invention has an anti-cancer action, a cancer metastasis inhibitory action, an angiogenesis inhibitory action, an antihypertensive action, an anti-pulmonary hypertension action, an anti-angina pectoris action, a cerebrovascular contraction suppressive action, an anti-
20 asthma action, a peripheral circulation improving action, an immature birth preventive action, an anti-arteriosclerosis action, an angiostenosis inhibitory action, an antiinflammatory action, an analgesic action, an immunosuppressive action, an autoimmune disorder suppressive action, an anti-AIDS action, a
25 preventive action of fertilization and nidation of fertilized egg, a bone formation promoting action, a bone resorption inhibitory action, a retinopathy treating action, a glaucoma treating action, a nerve axon regenerating action, a brain function improving action, a preventive action on cell
30 infection of digestive tract, an inhibitory action on fibrosis of various organs, an erectile dysfunction treating action and a prophylactic or therapeutic action on ischemia-reperfusion injury, and can be an anticancer drug, a suppressive agent of metastasis of cancer, a suppressive agent of angiogenesis, an

antihypertensive, an anti-pulmonary hypertension drug, an anti-angina pectoris drug, a cerebrovascular contraction suppressive agent, an anti-asthma drug, a peripheral circulation-improving drug, an early delivery-preventive drug, an anti-
5 arteriosclerosis drug, a suppressive agent of angiostenosis, an anti-inflammatory agent, an analgesic, an immunosuppressant, a suppressive agent of autoimmune disorder, an anti-AIDS drug, an inhibitor of fertilization and implantation of fertilized egg, a bone formation-promoting drug, a bone resorption inhibitor, a
10 therapeutic agent of retinopathy, a therapeutic agent of glaucoma, a nerve axon-regenerating drug, a brain function-improving drug, a preventive of cell infection of digestive tract, a suppressive agent of fibrosis of various organs, a therapeutic agent of erectile dysfunction or an agent for the
15 prophylaxis or therapy of ischemia-reperfusion injury.

The compounds of the present invention have high affinity for Rho kinase. Thus, the labeled compounds thereof are industrially useful as selective ligands of Rho kinase. The compounds of the present invention and labeled compounds
20 thereof (e.g., radio ligand of these compounds etc.) are useful as reagents for the study of Rho and Rho kinase and as diagnostics of the diseases relating to them.

When the compound of the present invention is used as the above-mentioned pharmaceutical agent, it is prepared into a
25 general pharmaceutical preparation. For example, the Rho kinase inhibitor of the present invention is mixed with a pharmaceutically acceptable carrier (e.g., excipient, binder, disintegrator, corrective, corrigent, emulsifier, diluent, solubilizer etc.) to give a pharmaceutical composition or a
30 pharmaceutical preparation in the form of tablet, pill, powder, granule, capsule, troche, syrup, liquid, emulsion, suspension, injection (e.g., liquid, suspension etc.), suppository, inhalant, percutaneous absorber, eye drop, eye ointment and the like in the form suitable for oral or parenteral preparation.

When preparing a solid preparation, an additive such as sucrose, lactose, cellulose sugar, D-mannitol, maltitol, dextran, starches, agar, arginates, chitins, chitosans, pectines, tragacanth, gum arabic, gelatins, collagens, casein,
5 albumin, calcium phosphate, sorbitol, glycine, carboxymethyl cellulose, polyvinylpyrrolidone, hydroxypropylcellulose, hydroxypropylmethylcellulose, glycerol, polyethylene glycol, sodium hydrogencarbonate, magnesium stearate, talc and the like are used. Tablets can be applied with a typical coating, where
10 necessary, to give sugar coated tablets, enteric tablets, film-coated tablets, two-layer tablets and multi-layer tablets.

When preparing a semi-solid preparation, animal and plant fats and oils (e.g., olive oil, corn oil, castor oil etc.), mineral fats and oils (e.g., petrolatum, white
15 petrolatum, solid paraffin etc.), wax (e.g., jojoba oil, carnauba wax, bee wax etc.), partly or entirely synthesized glycerol fatty acid esters (e.g., lauric acid, myristic acid, palmitic acid etc.), and the like are used. Examples of commercially available products of these include Witepsol
20 (manufactured by Dynamitnovel Ltd.), Farmazol (NOF Corporation) and the like.

When preparing a liquid preparation, an additive, such as sodium chloride, glucose, sorbitol, glycerol, olive oil, propylene glycol, ethyl alcohol and the like, is used. In
25 particular, when preparing an injection, a sterile aqueous solution such as physiological saline, isotonizing liquid, oily liquid (e.g., sesame oil and soybean oil) and the like is used. Where necessary, a suitable suspending agent such as sodium carboxymethylcellulose, nonionic surfactant, solubilizer (e.g.,
30 benzyl benzoate and benzyl alcohol), and the like can be concurrently used. Moreover, when an eye drop is prepared, an aqueous liquid or solution is used, which is particularly a sterile injectable aqueous solution. The liquid for an eye drop can appropriately contain various additives such as buffer

(preferred are borate buffer, acetate buffer, carbonate buffer and the like for less irritation), isotonizing agent, solubilizer, preservative, thickener, chelating agent, pH adjuster (preferably, pH is generally adjusted to about 6-8.5) and aromatic.

The content of the active ingredient in these preparation is 0.1-100 wt%, suitably 1-50 wt%, of the preparation. While subject to variation depending on the condition, body weight, age and the like of patient, in general, about 1-500 mg of the active ingredient is orally administered daily for an adult in a single dose or several doses.

The present invention is described in more detail in the following by way of Starting Material Synthetic Example, Example, Formulation Example and Experimental Example, to which the present invention is not limited.

In the Examples, Me means a methyl group, Za means a benzyloxycarbonyl group, Tr means a triphenylmethyl group, SEM means a 2-(trimethylsilyl)ethoxymethyl group.

Starting Material Synthetic Example 1: 4-hydroxythiochromane-7-carboxylic acid methyl ester

In a mixed solvent of ethanol (400 ml) and tetrahydrofuran (THF) (100 ml) was dissolved 4-oxythiochromane-7-carboxylic acid methyl ester (20.0 g) synthesized by a known method (Ger. Offen. DE 19532312 A16 WO 9709327 A1), and sodium borohydride (3.41 g) was added at 0°C. The mixture was stirred at room temperature for 1 hr. To the reaction mixture was added water (500 ml) and the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine and

dried over anhydrous magnesium sulfate. The solvent was concentrated under reduced pressure and the obtained residue was purified by silica gel column chromatography to give the objective 4-hydroxythiochromane-7-carboxylic acid methyl ester (19.6 g) as colorless crystals.

melting point: 79-81°C

¹H-NMR(400 MHz, DMSO-d₆)

δ=1.95-2.10(m, 2H), 2.90-3.05(m, 1H), 3.10-3.20(m, 1H), 3.82(s, 3H), 4.63(q, J=4Hz, 1H), 5.57(d, J=4Hz, 1H), 7.50(d, J=8Hz, 1H), 7.59(s, 1H), 7.60(d, J=8Hz, 1H)

Starting Material Synthetic Example 2: 4-azidethiochromane-7-carboxylic acid methyl ester

To a THF (500 ml) solution of 4-hydroxythiochromane-7-carboxylic acid methyl ester (19.0 g) and diphenyl phosphorazide (28.0 g) was added 1,8-diazabicyclo[5.4.0]-undecene (15.5 g) at 0°C, and the mixture was stirred at room temperature for 3 days. Water (500 ml) was added to the reaction mixture and the mixture was extracted with ethyl acetate. The organic layer was washed with 1N hydrochloric acid, water and saturated brine, and dried over anhydrous magnesium sulfate. The solvent was concentrated under reduced pressure and the obtained residue was purified by silica gel column chromatography to give a crude product (17.0 g) of the objective 4-azidethiochromane-7-carboxylic acid methyl ester as a colorless oil.

¹H-NMR(400 MHz, DMSO-d₆)

δ=1.95-2.10(m, 1H), 2.25-2.35(m, 1H), 3.00-3.10(m, 1H), 3.10-3.25(m, 1H), 3.83(s, 3H), 5.04(t, J=4Hz, 1H), 7.49(d, J=8Hz, 1H), 7.66(d, J=8Hz, 1H), 7.68(s, 1H)

Starting Material Synthetic Example 3: 4-aminothiochromane-7-carboxylic acid methyl ester

To a methanol (200 ml) solution of 4-azidethiochromane-7-carboxylic acid methyl ester (17.0 g) was added stannous chloride 2 hydrate (46.3 g), and the mixture was stirred under reflux for 5 hr. The reaction mixture was poured into saturated aqueous sodium hydrogencarbonate solution (500 ml) and the mixture was filtered through celite. The filtrate was extracted with chloroform, washed with water, saturated aqueous sodium hydrogencarbonate solution and saturated brine, and dried over anhydrous magnesium sulfate. The solvent was concentrated under reduced pressure and the obtained residue was purified by silica gel column chromatography to give the objective 4-aminothiochromane-7-carboxylic acid methyl ester (8.04 g) as a colorless oil.

$^1\text{H-NMR}$ (400 MHz, DMSO-d_6)

δ =1.90-2.05 (m, 2H), 2.90-3.00 (m, 1H), 3.15-3.30 (m, 1H), 3.81 (s, 3H), 3.90 (t, J =4Hz, 1H), 7.50-7.65 (m, 3H)

Starting Material Synthetic Example 4: 4-(benzyloxycarbonylamino)thiochromane-7-carboxylic acid methyl ester

To an ethyl acetate (200 ml) solution of 4-aminothiochromane-7-carboxylic acid methyl ester (8.00 g) was added saturated aqueous sodium hydrogencarbonate solution (200

ml), and benzyloxycarbonyl chloride (6.75 g) was added at room temperature. The mixture was stirred at the same temperature for 2 hrs. The reaction mixture was extracted with ethyl acetate, washed with water, saturated aqueous sodium hydrogencarbonate solution and saturated brine, and dried over anhydrous magnesium sulfate. The solvent was concentrated under reduced pressure and the obtained residue was purified by silica gel column chromatography to give the objective 4-(benzyloxycarbonylamino)thiochromane-7-carboxylic acid methyl ester (12.8 g) as colorless crystals.

melting point: 128-130°C

Starting Material Synthetic Example 5: 4-

(benzyloxycarbonylamino)-1,1-dioxythiochromane-7-carboxylic acid methyl ester

To a methylene chloride (200 ml) solution of 4-(benzyloxycarbonylamino)thiochromane-7-carboxylic acid methyl ester (8.50 g) was added 70% meta-chloroperoxybenzoic acid (12.9 g) at room temperature and the mixture was stirred at room temperature for 1 hr. To the reaction mixture were added saturated aqueous sodium hydrogencarbonate solution (100 ml) and saturated aqueous sodium thiosulfate solution (100 ml) and the mixture was extracted with chloroform. The obtained organic layer was washed with water and saturated brine, dried over anhydrous magnesium sulfate. The solvent was concentrated under reduced pressure, and the obtained residue was purified by silica gel column chromatography to give the objective 4-(benzyloxycarbonylamino)-1,1-dioxythiochromane-7-carboxylic acid methyl ester (7.23 g) as colorless crystals.

melting point: 139-140°C

Starting Material Synthetic Example 6: 4-

(benzyloxycarbonylamino)-1,1-dioxythiochromane-7-carboxylic acid

5 To a mixed solution of 4-(benzyloxycarbonylamino)-1,1-dioxythiochromane-7-carboxylic acid methyl ester (4.00 g) in methanol (200 ml) and water (50 ml) was added potassium carbonate (10.0 g) and the mixture was stirred under reflux for 2 hr. Then dilute hydrochloric acid was added until the
10 reaction mixture had pH 1, and the precipitated crystals were collected by filtration. The crystals were dissolved in a mixed solvent of methylene chloride (200 ml) and dioxane (50 ml) and dried over anhydrous magnesium sulfate. The solvent was concentrated to give the objective 4-(benzyloxycarbonylamino)-
15 1,1-dioxythiochromane-7-carboxylic acid (3.73 g) as a colorless amorphous solid.

¹H-NMR (400 MHz, DMSO-d₆)

δ=2.40-2.50 (m, 2H), 3.65-3.75 (m, 1H), 3.75-3.85 (m, 1H),
5.12 (br.s, 3H), 7.30-7.40 (m, 6H), 7.56 (d, J=8Hz, 1H), 8.14 (d,
20 J=8Hz, 1H), 8.24 (s, 1H), 13.55 (br.s, 1H)

Starting Material Synthetic Example 7: 4-

(benzyloxycarbonylamino)-1,1-dioxo-N-(4-pyridyl)thiochromane-7-carboxamide

25 4-(Benzyloxycarbonylamino)-1,1-dioxythiochromane-7-carboxylic acid (4.00 g) was suspended in chloroform (150 ml)

and thionyl chloride (3.43 g) and N,N-dimethylformamide (3.0 ml) were added. This mixture was refluxed under heating and stirred for 1 hr. The reaction system was cooled to room temperature and the solvent was evaporated under reduced pressure. The obtained crystals were dissolved in acetonitrile (25 ml) and added dropwise to a solution of 4-aminopyridine (903 mg) and triethylamine (1.94 g) in acetonitrile (50 ml) at 0°C. The mixture was allowed to warm to room temperature and continuously stirred for 2 hr. Water (500 ml) was added to the reaction mixture and the mixture was extracted with ethyl acetate. The obtained organic layer was washed with water and saturated brine, and dried over anhydrous magnesium sulfate. The solvent was concentrated under reduced pressure and the obtained residue was purified by silica gel column chromatography to give the objective 4-(benzyloxycarbonylamino)-1,1-dioxy-N-(4-pyridyl)thiochromane-7-carboxamide (2.02 g) as colorless crystals. melting point: 217-220°C (decomposition)

Starting Material Synthetic Example 8: 4-(benzyloxycarbonylamino)thiochromane-7-carboxylic acid

To a mixed solution of 4-(benzyloxycarbonylamino)-thiochromane-7-carboxylic acid methyl ester (3.20 g) in methanol (50 ml), tetrahydrofuran (100 ml) and water (50 ml) was added 1N aqueous sodium hydroxide solution (20 ml), and the mixture was stirred at room temperature for 5 hr. Dilute hydrochloric acid was added to the reaction mixture until the pH became 1, and the precipitated crystals were collected by filtration. The crystals were recrystallized from acetone-hexane to give the objective 4-(benzyloxycarbonylamino)-

thiochromane-7-carboxylic acid (2.74 g) as colorless crystals.

4-(Benzyloxycarbonylamino)thiochromane-7-carboxylic acid (2.80 g) was suspended in dichloromethane (120 ml), and oxalyl chloride (2.07 g) and N,N-dimethylformamide (15 ml) were added. This mixture was stirred at room temperature for 1 hr and the solvent was evaporated under reduced pressure. The obtained acid chloride was dissolved in acetonitrile (25 ml) and N,N-dimethylformamide (20 ml) and added dropwise to a solution of 4-aminopyridine (768 mg) and triethylamine (1.55 g) in acetonitrile (50 ml) at 0°C. The mixture was allowed to warm to room temperature and continuously stirred for 30 min. 4-Aminopyridine (768 mg) and triethylamine (1.55 g) were added to the reaction mixture and this suspension was further stirred at room temperature for 3 hr. The precipitated crystals were removed by suction filtration. The obtained filtrate was stood overnight at 0°C and the precipitated crystals were dried under reduced pressure to give the objective 4-(benzyloxycarbonylamino)-N-(4-pyridyl)thiochromane-7-carboxamide (1.57 g) as colorless crystals.

yl)thiochromane-7-carboxamide

To (S)-4-(benzyloxycarbonylamino)-N-(1-[2-
(trimethylsilyl)ethoxymethyl]pyrrolo[2,3-b]pyridin-4-
5 yl)thiochromane-7-carboxamide (1.02 g) was added a 4N
hydrochloric acid dioxane solution (30 ml) and the mixture was
stirred at room temperature for 6 hr. Water (100 ml) was added
to the reaction mixture and potassium carbonate was added until
the reaction mixture shows alkalinity. This suspension was
10 stood still at 0°C for 30 min and the precipitated crystals
were collected by filtration to give a crude product (766 mg)
of (S)-4-(benzyloxycarbonylamino)-N-(1-hydroxymethylpyrrolo-
[2,3-b]pyridin-4-yl)thiochromane-7-carboxamide.

The obtained (S)-4-(benzyloxycarbonylamino)-N-(1-
15 hydroxymethylpyrrolo[2,3-b]pyridin-4-yl)thiochromane-7-
carboxamide (766 mg) was dissolved in methanol (10 ml) and
tetrahydrofuran (20 ml), and an aqueous solution (30 ml) of
sodium acetate (5.00 g) was added. The reaction mixture was
stirred under reflux for 5 hr and allowed to return to room
20 temperature. Water (100 ml) was added and the precipitated
crystals were collected by filtration to give the objective
(S)-4-(benzyloxycarbonylamino)-N-(1H-pyrrolo[2,3-b]pyridin-4-
yl)thiochromane-7-carboxamide (504 mg) as a pale yellow solid.

The compound of the present invention, lactose and corn starch were mixed, kneaded with Polyvinylpyrrolidone K30 paste solution and passed through a 20-mesh sieve for granulation. After drying at 50°C for 2 hrs, the granules were passed through a 24-mesh sieve, and talc and magnesium stearate were mixed. The mixture was filled in hard capsules (No. 4) to give capsules weighing 120 mg.

The pharmacological action of the pharmaceutical agent of the present invention is explained in the following by way of experimental examples.

Experimental Example 1: Rho kinase inhibitory activity

(inhibition of bovine aorta thoracia Rho kinase)

The Rho kinase was prepared from bovine aorta of thorax by partial purification as in the following. The artery was minced and homogenized with a 9-fold amount of 50 mM Tris-hydroxymethylaminomethane (Tris) (pH=7.4), 1 mM dithiothreitol, 1 mM EGTA, 1 mM EDTA, 100 μ M p-amidinophenylmethylsulfonyl fluoride, 5 μ M E-64, 5 μ M leupeptine and 5 μ M pepstatin A. The homogenate was centrifuged (10,000 \times g, 30 minutes) to give a supernatant. The supernatant was adsorbed onto a hydroxyapatite column. The column was washed with 0.2 M phosphate buffer (pH=6.8). The standard product of Rho kinase was eluted with 0.4 M phosphate buffer (pH=6.8). The Rho kinase was assayed as follows.

A reaction mixture (total amount 50 μ l) containing 50 mM Tris, 1 mM EDTA, 5 mM $MgCl_2$, 50 μ g/ml histone, 10 μ M GTP γ S, 100 μ g/ml Rho, 2 μ M [32 P]ATP, the Rho kinase (3 μ l) prepared in the above and the test compound was reacted at 30°C for 5 minutes. The reaction was terminated by the addition of 25% trichloroacetic acid (TCA) solution (1 ml) and the mixture was stood at 4°C for 30 minutes. Then, the mixture was filtered

through a membrane filter (HAWP type, Millipore), and the radioactivity of the filter was counted on a liquid scintillation counter. The inhibitory activity of the test compound was calculated from the following formula based on the comparison of the radioactivity with the sample without the test compound (control). The results are shown in Table 1.

$$10 \text{ Inhibition (\%)} = \frac{\text{cpm under control} - \frac{\text{cpm in the presence of test compound}}{\text{cpm under control}}}{\text{cpm under control}} \times 100$$

Experimental Example 2: Rho kinase inhibitory activity
(inhibitory activity on human Rho kinase)

15 Human Rho kinase was prepared as follows. Using the following primer prepared based on the human ROCK-1 cDNA sequence reported by Ishizaki et al. (T. Ishizaki et al. EMBO J. 15, 1885-1893, 1996) and Human Placenta cDNA (Clontech, Lot. 7030086) as a template, PCR amplification was carried out.

The amplified DNA fragment was digested with Sac I and Not I, and inserted into the Sac I/Not I site of a commercially available vector for insect cell expression, pBAC-1 (Novagenn), whereby a full-length human ROCK-1 protein expression vector
35 was prepared. For preparation of a vector that expresses the kinase domain (1 to 477 amino acids) of the ROCK-1 protein, the full-length protein expression vector was digested with Xba I/Xho I to remove the C-terminal region of the human ROCK-1

cdNA, and a DNA linker, enclosed with a square in Fig. 1, was inserted thereinto and treated, whereby a vector that expresses human ROCK-1 kinase domain (1 to 477 amino acids) having the His-Tag sequence of Fig. 1 added to the C-terminal was
5 prepared.

The kinase domain expression vector prepared above was used to prepare a recombinant baculovirus for kinase domain expression using BacVector-1000 Transfection Kits (Novagen). For expression of a protein, Sf9 cell was infected with a
10 recombinant virus so that MOI=10, and incubated in a commercially available medium (Sf-900II SFM + 5% FBS + penicillin-streptomycin, GIBCO BRL) at 28°C for 3 days.

After the incubation, the cells were recovered by centrifugal separation, homogenized in a lysis buffer (20 mM
15 Tris-Cl, pH=8.0, 0.5 mM DTT, 0.1% Triton X-100, 300 mM NaCl, 2 mM imidazole, 0.5 mM EDTA, 1 mM benzamidine, 1 µg/ml leupeptin, 1 µg/ml pepstatin A, 1 µg/ml aprotinin, 0.1 mM PMSF), and subjected to centrifugal separation to give a supernatant. The expressed protein was purified from the supernatant using an
20 Ni-chelate affinity column (Qiagen) utilizing the His-Tag sequence added to the C-terminal side of the expressed protein.

The human Rho kinase assay was performed as follows. A 96 well microplate (trade name: Flash Plate, NEN) coated with a plastic scintillator was used as a reaction vessel. To coat
25 histone used as a substrate, 100 µl of phosphate buffered saline containing histone (final concentration of histone 2.5 µg/ml) was added and the mixture was stood at room temperature for 1 hr. The solution in the plate was discarded and 300 µl of phosphate buffered saline containing 0.01% bovine serum
30 albumin was added and discarded. This was repeated three times.

A reaction mixture (total amount 100 µl) containing 20 mM (N-morpholino)propanesulfone acid-NaOH (pH 7.2), 0.1 mg/ml bovine serum albumin, 5 mM dithiothreitol, 10 mM β-

glycerophosphoric acid, 50 μ M sodium vanadate, 10 mM magnesium chloride, 1 μ M [32 P] ATP, Rho kinase prepared by the above-mentioned method and the test compound was allowed to react at room temperature for 20 min. The reaction was stopped by adding 0.7% phosphoric acid solution (100 μ l) and the plate was washed three times. Then, the radioactivity incorporated into the substrate was measured using a liquid scintillation counter. The inhibitory activity (% inhibition) of the test compound was calculated from the following formula wherein the percent inhibition when the test compound was not added was 0%, and the percent inhibition when the enzyme was not added was 100%. In addition, the IC_{50} value was determined using 4 or 5 points sandwiching 50% percent inhibition of the obtained percent enzyme inhibition, by nonlinear regression.

(calculation formula 1)

Percent inhibition (%) = $\{1 - (\text{assay value of compound} - \text{assay value without enzyme addition}) / (\text{assay value without enzyme inhibitor} - \text{assay value without enzyme})\} \times 100$

INDUSTRIAL APPLICABILITY

The results of the above-mentioned pharmacological tests have revealed that the compound of the formula (I) has a superior Rho kinase inhibitory action. From this, the compound of the formula (I), an isomer thereof and a pharmaceutically acceptable salt thereof of the present invention are useful as an anticancer drug, a suppressive agent of metastasis of cancer, a suppressive agent of angiogenesis, an antihypertensive, an anti-pulmonary hypertension drug, an anti-angina pectoris drug, a cerebrovascular contraction suppressive agent, an anti-asthma drug, a peripheral circulation-improving

drug, an early delivery-preventive drug, an anti-
arteriosclerosis drug, a suppressive agent of angiostenosis, an
anti-inflammatory agent, an analgesic, an immunosuppressant, a
suppressive agent of autoimmune disorder, an anti-AIDS drug, an
5 inhibitor of fertilization and implantation of fertilized egg,
a bone formation-promoting drug, a bone resorption inhibitor, a
therapeutic agent of retinopathy, a therapeutic agent of
glaucoma, a nerve axon-regenerating drug, a brain function-
improving drug, a preventive of cell infection of digestive
10 tract, a suppressive agent of fibrosis of various organs, a
therapeutic agent of erectile dysfunction and an agent for the
prophylaxis or therapy of ischemia-reperfusion injury.

This application is based on a patent application No.
15 2000-074764 filed in Japan, the contents of which are hereby
incorporated by reference.

WHAT IS CLAIMED IS

1. An amide compound of the formula

wherein

- 5 R^1 is hydrogen, alkyl, cycloalkyl, halogen, hydroxyl, alkoxy, haloalkyl, hydroxyalkyl, aralkyl, acyl, alkoxycarbonyl, alkylcarbamoyl, alkylsulfone, nitro, amino optionally having substituents, cyano or phenyl;
- 10 R^2 is hydrogen, alkyl, cycloalkyl, phenyl or aralkyl, or a group represented by the formula (II)

- 15 in the formula (II), R^3 is hydrogen, alkyl or amino optionally having substituents, and R^4 is hydrogen, alkyl, aralkyl, phenyl, nitro or cyano, or R^3 and R^4 may be bonded to form a heterocyclic ring containing, in the ring, oxygen atom, sulfur atom or nitrogen atom optionally having a substituent;
- a is an integer of 1 to 4;
- 20 X is CH_2 , O, S, SO_2 or NR^7 wherein R^7 is hydrogen, alkyl, aralkyl, haloalkyl or acyl; and
- Y is a group of the formula (III), (IV), (V) or (VI):

in the formulas (III), (IV), (V) and (VI), R^5 and R^6 are

the same or different and each is hydrogen, alkyl, cycloalkyl, phenyl, halogen, hydroxyl, alkoxy, alkoxyalkyl, nitro, amino optionally having substituents or cyano,

5 an isomer thereof or a pharmaceutically acceptable salt thereof.

2. The amide compound of claim 1, wherein, in the formula (I), R^1 is hydrogen, alkyl, halogen, hydroxyl, alkoxy, nitro, amino
 10 optionally having substituents or cyano; R^2 is hydrogen; a is an integer of 1 to 3; X is CH_2 , S , O or SO_2 ; and Y is a group of the formula (III), (IV) or (V), wherein R^5 and R^6 in the formulas (III), (IV) and (V) are the same or different and each
 15 optionally having substituents or cyano, an isomer thereof or a pharmaceutically acceptable salt thereof.

3. The amide compound of claim 2, which is selected from the group consisting of

20 (S)-4-amino-N-(4-pyridyl)thiochromane-7-carboxamide,
 (S)-4-amino-N-(4-pyridyl)thiochromane-7-carboxamide 1,1-dioxide,
 (S)-4-amino-N-(1H-pyrazolo[3,4-b]pyridin-4-yl)thiochromane-7-carboxamide,
 25 (S)-4-amino-N-(1H-pyrazolo[3,4-b]pyridin-4-yl)thiochromane-7-carboxamide 1,1-dioxide,
 (S)-4-amino-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)thiochromane-7-carboxamide and
 (S)-4-amino-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)thiochromane-7-
 30 carboxamide 1,1-dioxide,
 an isomer thereof or a pharmaceutically acceptable salt thereof.

4. The amide compound of claim 2, which is selected from the

group consisting of

- (S)-4-amino-6-methyl-N-(4-pyridyl)thiochromane-7-carboxamide,
- (S)-4-amino-6-methyl-N-(4-pyridyl)thiochromane-7-carboxamide
1,1-dioxide,
- 5 (S)-4-amino-6-chloro-N-(4-pyridyl)thiochromane-7-carboxamide,
- (S)-4-amino-6-chloro-N-(4-pyridyl)thiochromane-7-carboxamide
1,1-dioxide,
- (S)-4-amino-8-methyl-N-(4-pyridyl)thiochromane-7-carboxamide,
- (S)-4-amino-8-methyl-N-(4-pyridyl)thiochromane-7-carboxamide
10 1,1-dioxide,
- (S)-4-amino-6-methyl-N-(1H-pyrrolo[2,3-b]pyridin-4-
yl)thiochromane-7-carboxamide 1,1-dioxide and
- (S)-4-amino-6-chloro-N-(1H-pyrrolo[2,3-b]pyridin-4-
yl)thiochromane-7-carboxamide 1,1-dioxide,
- 15 an isomer thereof or a pharmaceutically acceptable salt
thereof.

- 5. A pharmaceutical agent comprising the amide compound of any
of claims 1 to 4, an isomer thereof or a pharmaceutically
20 acceptable salt thereof.

- 6. A pharmaceutical composition comprising the amide compound
of any of claims 1 to 4, an isomer thereof or a
pharmaceutically acceptable salt thereof, and a
25 pharmaceutically acceptable carrier.

- 7. The pharmaceutical agent of claim 5, wherein the
pharmaceutical agent is at least one member selected from the
group consisting of an anticancer drug, a suppressive agent of
30 metastasis of cancer, a suppressive agent of angiogenesis, an
antihypertensive, an anti-pulmonary hypertension drug, an anti-
angina pectoris drug, a cerebrovascular contraction suppressive
agent, an anti-asthma drug, a peripheral circulation-improving
drug, an early delivery-preventive drug, an anti-

arteriosclerosis drug, a suppressive agent of angiostenosis, an
anti-inflammatory agent, an analgesic, an immunosuppressant, a
suppressive agent of autoimmune disorder, an anti-AIDS drug, an
inhibitor of fertilization and implantation of fertilized egg,
5 a bone formation-promoting drug, a bone resorption inhibitor, a
therapeutic agent of retinopathy, a therapeutic agent of
glaucoma, a nerve axon-regenerating drug, a brain function-
improving drug, a preventive of cell infection of digestive
tract, a suppressive agent of fibrosis of various organs, a
10 therapeutic agent of erectile dysfunction and an agent for the
prophylaxis or therapy of ischemia-reperfusion injury.

8. A Rho kinase inhibitor comprising the amide compound of any
of claims 1 to 4, an isomer thereof or a pharmaceutically
15 acceptable salt thereof.

9. A therapeutic drug for a disease, in which Rho kinase is
involved, which comprises the amide compound of any of claims 1
to 4, an isomer thereof or a pharmaceutically acceptable salt
20 thereof.

10. A reagent comprising the amide compound of any of claims 1
to 4, an isomer thereof or a pharmaceutically acceptable salt
thereof.
